Turbine Bypass Valve

Steam condition regulating series DZE

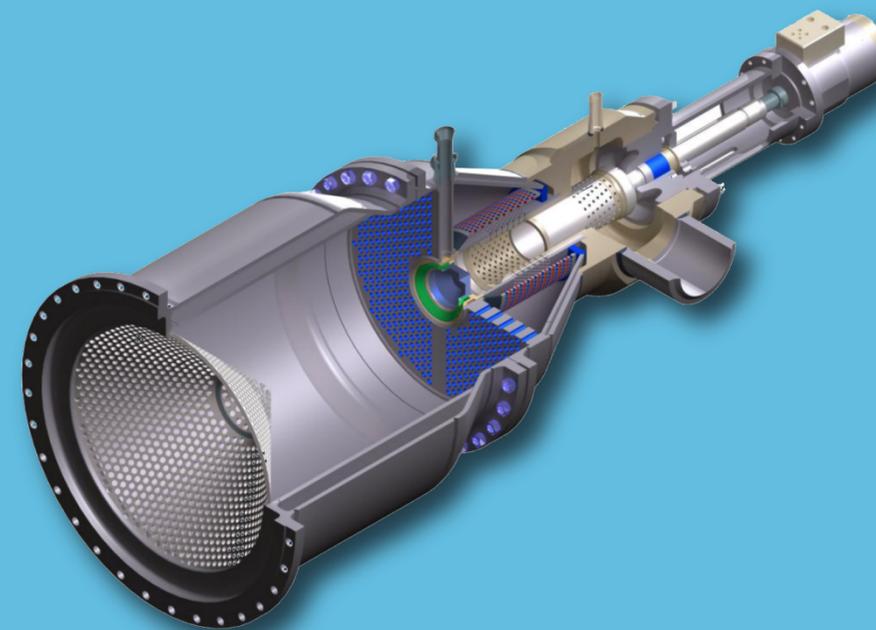

Advantage

- Steam control completely
- 1 second temperature control of steam outlet
- Outlet steam saturation is insured
- Evaporate at high speed insure the stable temperature control
- Also useable for low temperature and low pressure
- Spray system and stem are protected cause of the high speed mixed evaporation
- No maintenance of spray system as well as silencer

Application

The DZE is suitable for conditions of the highest pressure and temperature. Steam condition regulating valves of this type DZE are used in all branches of industry where steam has to be simultaneously expanded to a lower pressure and cooled.

The DZE carries out both duties without the need to install a cooler. For this reason its use is particularly attractive in power stations, steam distribution mains in the chemical industry and in paper mills and sugar factories etc.
